Polypectomy

Large opening angle, even if the snare is partially retracted

More than just a cold snare - a hybrid comprising HOT and COLD

Over 90% of all polyps are smaller than 10 mm. Especially a number of small, flat lesions in the caecum or right colon constitute special challenges for the instrumentation. CrossSnare is the first hybrid snare, and the only one, to have been specially developed for the majority of polyps of clinical relevance in terms of ablation. The large opening angle, even if the snare is partially retracted, ensures optimal snare adjustment to match the size of the polyps between 3 mm and 15 mm. Compacted Wire Technology provides tissue-sparing cutting properties - both with and without HF current.

CrossSnare Polypectomy snares for Cold and HF snaring

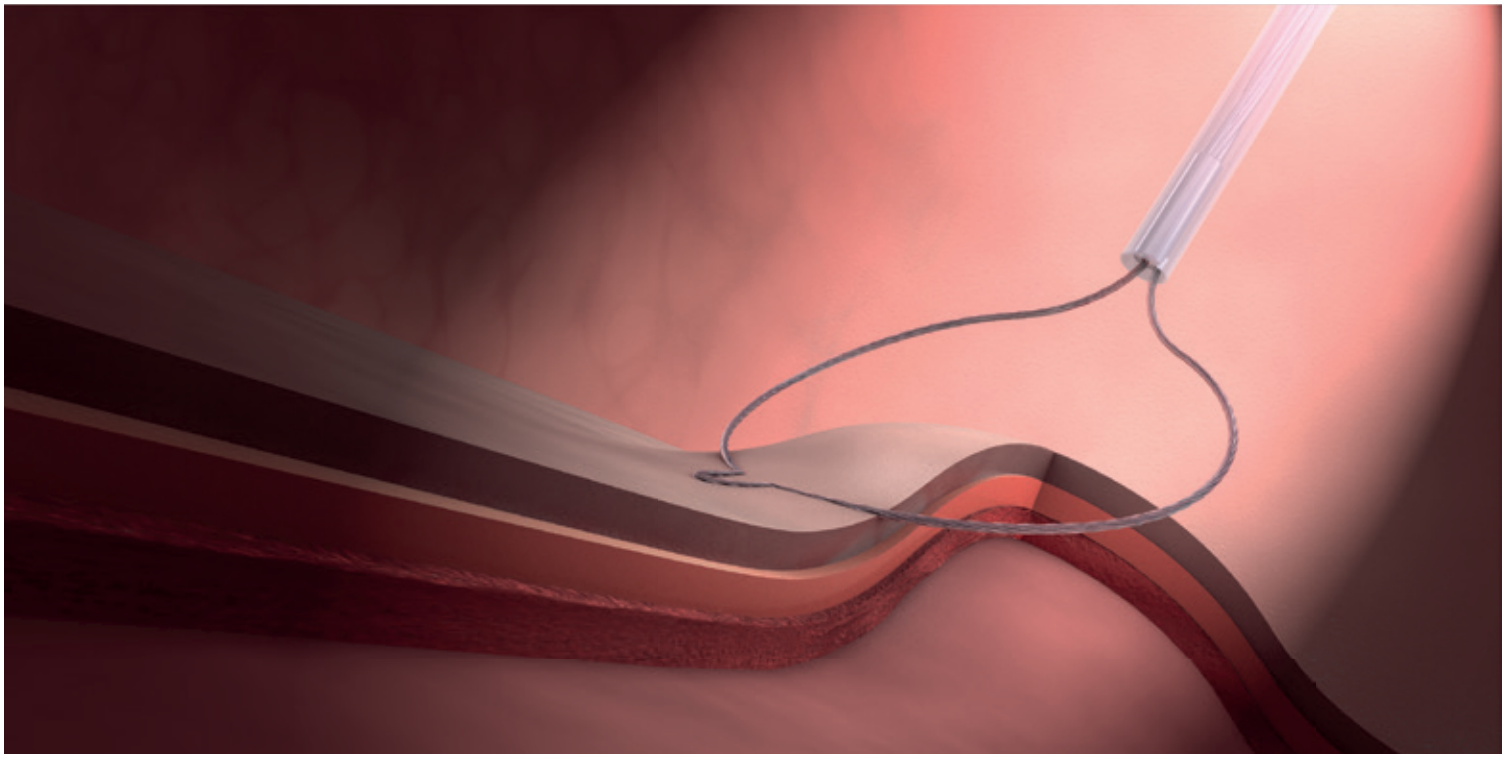
Errors excepted.

Polypectomy



Compacted Wire Technology (CWT)

Compacted Wire Technology combines the benefits of a mono-filament snare with those of a braided snare:

- ✔ Easier positioning with flat lesions
- ✔ Sparing tissue ablation
